a.) Amendments to the Specification

Please amend the paragraph at page 17, lines 11-18 to read as follows.

Examples of the complex carbohydrate precursor used in the formation of the complex carbohydrate include monosaccharides, oligosaccharides, proteins, peptides, glycoproteins, glycolipids and glycopeptides. Specific examples include <u>but are not limited to N-acetylglucosamine</u>, GlcNAc β 1-3Ga1 β 1-4Glc, and the like. The complex carbohydrate precursor can be used at a concentration of from 0.1 to 100 nM, preferably from 0.5 to 50 mM.
